Extreme weather conditions are on the rise all over the world as a result of global warming. Consequences such as high wind speeds, an increased number of storms and heavy rainfall cannot be ignored. Therefore, designers and installers will face new challenges particularly with regard to wind loads. This does not only affect building structures (statics of the structure), but also air-termination systems.

In the field of lightning protection, the DIN 1055-4:2005-03 and DIN 4131 standards have been used as dimensioning basis so far. In July 2012, these standards were replaced by the Eurocodes which provide Europe-wide standardised structural design rules (planning of structures).

The DIN 1055-4:2005-03 standard was integrated in Eurocode 1 (EN 1991-1-4: Actions on structures – Part 1-4: General actions - Wind actions) and DIN V 4131:2008-09 in Eurocode 3 (EN 1993-3-1: Part 3-1:Towers, masts and chimneys – Towers and masts). Thus, these two standards form the basis for dimensioning air-termination systems for lightning protection systems, however, Eurocode 1 is primarily relevant.

The following parameters are used to calculate the actual wind load to be expected:

- Wind zone (Germany is divided into four wind zones with different base wind speeds)
- Terrain category (the terrain categories define the surrounding of a structure)
- Height of the object above ground level
- Height of the location (above sea level, typically up to 800 m above sea level)

Other influencing factors such as:

- Icing
- Position on a ridge or top of a hill
- Object height above 300 m
- Terrain height above 800 m (sea level)

have to be considered for the specific installation environment and have to be calculated separately.

The combination of the different parameters results in the gust wind speed which is to be used as a basis for dimensioning air-termination systems and other installations such as elevated ring conductors. In our catalogue, the maximum gust wind speed is specified for our products to be able to determine the required number of concrete bases depending on the gust wind speed, for example in case of isolated air-termination systems. This does not only allow to determine the static stability, but also to reduce the necessary weight and thus the roof load.

#### Important note:

The "maximum gust wind speeds" specified in this catalogue for the individual components were determined according to the Germany-specific calculation requirements of Eurocode 1 (DIN EN 1991-1-4/NA:2010-12) which are based on the wind zone map for Germany and the associated country-specific topographic particularities.

When using products of this catalogue in other countries, the country-specific particularities and other locally applicable calculation methods, if any, described in Eurocode 1 (EN 1991-1-4) or in other locally applicable calculation regulations (outside Europe) must be observed. Consequently, the maximum gust wind speeds mentioned in this catalogue only apply to Germany and are only a rough orientation for other countries. The gust wind speeds have to be newly calculated according to the country-specific calculation methods!

We accept no liability for misprints, modifications and errors. Any reproduction of this catalogue, as a whole or in parts, is only allowed upon approval of DEHN + SÖHNE.

The background image shows a dramatic night sky filled with dark, billowing clouds. Several bright, branching lightning bolts are visible, striking down from the clouds towards the horizon. One prominent lightning bolt starts from the upper left and extends down to the bottom left corner. Another bolt originates from the upper right and branches out towards the center. The overall atmosphere is one of power and intensity.

Benjamin Franklin, inventor of the lightning rod, recognised lightning as an electrical phenomenon back in 1752. It is common knowledge today that lightning protection is more than a "cage" of air-termination system, down conductors and earth-termination system. A comprehensive protection system which is explained and specified in standard, is necessary. The current standard series IEC/EN 62305 is an internationally coordinated standard and provides a comprehensive overall concept for lightning protection.

DEHN offers components and devices for complete lightning protection systems. Components for the installation of the external lightning protection system have to meet the mechanical and electrical requirements as specified in the standard series EN 62561-x. Our products are of course manufactured and tested in accordance with these relevant standards.

It has been, and will always be our aim to be one step ahead of the current state of engineering and to continuously improve in the interest and benefit of our customers.

In our highly specialised laboratories lightning parameters are simulated in order to test installations/systems for lightning safety and to upgrade them if necessary.

Special solutions for lightning and surge protective systems can be tested and analysed in accordance with the current international and national standards. In addition, we have been working actively on international and national standardisation committees for decades. You can be assured that our devices and extensive knowledge are based on the current state of standardisation. Implementation of a functional lightning protection system requires the application of components and devices that are tested and conform to the latest standards. The installers of lightning protection systems have to choose the components in accordance with the installation requirements of individual sites and to install them correctly. Apart from the mechanical requirements, the electrical criteria also have to be considered and complied with in lightning protection engineering. DEHN provides tests and analyses of lightning and surge protection systems for your safety.

## Test Reports, Test Certificates and Data Sheets

DEHN provides you with detailed installation instructions, data sheets and test reports in order to support you in the design of installations and systems. The necessary technical details are practice-orientated and documentation is continuously updated and always available at [www.dehn-international.com](http://www.dehn-international.com). After the system installation we also assist you in the technical documentation, e.g. concerning a system inspection and the corresponding test certificates (e.g. a lightning protection system tested in accordance with IEC/EN 62305-3 or a documentation of the earth-termination system). These are also available under [www.dehn-international.com](http://www.dehn-international.com).

Numerous brochures with practical information on our products as well as many application proposals complete the range of services available and can also be downloaded at [www.dehn-international.com](http://www.dehn-international.com).

## Planning Software for Lightning Protection Systems

The DEHNSupport Toolbox software program provides easy to use and practical programs for planners and installers, ranging from a complete risk assessment to the calculation of the air-termination rod length, the determination of the separation distance and the calculation of the length of the earth electrodes. Designing of a lightning protection system is thus considerably easier. See also page 6 for more details.

**Program contents****Calculation Program for Lightning Protection Systems**

The DEHNSupport Toolbox is a calculation tool for the specific determination and implementation of lightning and surge protection measures based on the requirements of the IEC/EN 62305-1 to 4 standard series. In addition to international requirements, country-specific adaptations are integrated in the software which are regularly extended. In order to specifically support users with their application, the DEHNSupport Toolbox offers a variety of planning aids:

**DEHN Risk Tool; risk management****in accordance with IEC/EN 62305-2**

Risk analysis: An analysis of the hazard potential for structures allows an economically reasonable selection of protection measures which are suitable for the characteristics and the utilisation of the building.

**DEHN Air-Termination Tool; calculation of the air-termination rod length in accordance with IEC/EN 62305-3**

This software tool allows for calculating air-termination rod lengths depending on the class of LPS.

**DEHN Distance Tool; calculation of the separation distance in accordance with IEC/EN 62305-3**

Components used for installing the external lightning protection system shall meet the mechanical and electrical requirements, as specified in the EN 62561-x standard series. Lightning protection components are categorised according to their function, for example connection components (EN 62561-1), conductors and earth electrodes (EN 62561-2).

### Testing of conventional lightning protection components

Metal lightning protection components (clamps, conductors, air-termination rods, earth electrodes) exposed to weathering have to be subjected to artificial ageing/conditioning prior to testing to verify their suitability for the intended application. In accordance with EN 60068-2-52 and EN ISO 6988 metal components are subjected to artificial ageing and tested in two steps.

### Natural weathering and exposure to corrosion of lightning protection components

#### Step 1: Salt mist treatment

This test applies to components or devices for installation in saline atmosphere. The specimens are tested with severity level 2 in a salt mist chamber (Figure 1) for three days. Test level 2 provides three spraying phases of 2 h each, using a 5% sodium chloride solution (NaCl) at a temperature between 15 °C and 35 °C followed by a humidity storage at a relative humidity of 93  $\pm 2$  % and a temperature of 40  $\pm 2$  °C for 20 to 22 hours in accordance with EN 60068-2-52.

#### Step 2: Humid sulphurous atmosphere treatment

This test is to evaluate the resistance of materials or objects to condensed humidity containing sulphur dioxide in accordance with EN ISO 6988.

The test is carried out in a test chamber (Figure 2) in seven test cycles of 24 h each cycle in a sulphur dioxide concentration of  $667 \times 10^{-6}$  ( $\pm 24 \times 10^{-6}$ ) of the volume. Each cycle has a heating period of 8 h at a temperature of 40  $\pm 3$  °C in a humid, saturated atmosphere followed by a rest period of 16 h. After that, the humid sulphurous atmosphere is replaced. Both components for outdoor use and components buried in the ground are subjected to ageing / conditioning. For components buried in the ground additional requirements and measures have to be considered. No aluminium clamps or conductors may be buried in the ground. If stainless steel is to be buried in the ground, only high-alloy stainless steel may be used, e.g. StSt (V4A). In accordance with the German DIN VDE 0151 standard, StSt (V2A) is not allowed. Components for indoor use such as equipotential bonding bars do not have to be subjected to ageing / conditioning. The same applies to components which are embedded in concrete. These components are therefore often made of non-galvanised (black) steel.

### Air-termination systems / air-termination rods

Air-termination rods are typically used as air-termination systems. They are available in many different designs, for example with a length of 1 m for installation with concrete base on flat roofs, up to the telescopic lightning protection masts with a length of 25 m for biogas plants.

EN 62561-2 specifies the minimum cross sections and the permissible materials with the corresponding electrical and mechanical properties for air-termination rods.

In case of air-termination rods with larger heights, the bending resistance of the air-termination rod and the stability of complete systems (air-termination rod in a tripod) have to be verified by means of a static calculation. The required cross sections and materials have to be selected based on this calculation. The wind speeds of the relevant wind load zone also have to be taken into account for this calculation.

### Testing of connection components

Connection components, or often simply called clamps, are used as lightning protection components to connect conductors (down conductor, air-termination conductor, earth entry) to each other or to an installation. Depending on the type of clamp and clamp material, a lot of different clamp combinations are possible. The conductor routing and the possible

Figure 1:  
Test in a salt mist chamber.

Figure 2:  
Test in a Kesternich chamber.

material combinations are decisive in this respect. The kind of conductor routing describes how a clamp connects the conductors in cross or parallel arrangement.

In case of a lightning current load, clamps are subjected to electrodynamic and thermal forces which highly depend on the kind of conductor routing and the clamp connection. **Table 1** shows materials which may be combined without causing contact corrosion.

The combination of different materials with one another and their different mechanical strengths and thermal properties have different effects on the connection components when lightning current flows through them. This is particularly evident for stainless steel (StSt) connection components where high temperatures occur due to the low conductivity as soon as lightning currents flow through them. Therefore, a lightning current test in compliance with EN 62561-1 has to be carried out for all clamps. In order to test the worst case, not only the different conductor combinations, but also the material combinations specified by the manufacturer have to be tested.

### Tests based on the example of an MV clamp

At first, the number of test combinations has to be determined. The MV clamp used is made of stainless steel (StSt) and hence can be combined with steel, aluminium, StSt and copper conductors as stated in Table 1. Moreover, it can be connected in cross and parallel arrangement which also has to be tested. This means that there are eight possible test combinations for the MV clamp used (Figures 3 and 4).

In accordance with EN 62561 each of these test combinations has to be tested on three suitable specimens / test set-ups. This means that 24 specimens of this single MV clamp have to be tested to cover the complete range. Every single specimen is mounted with the adequate tightening torque in compliance with normative requirements and is subjected to artificial ageing by means of salt mist and humid sulphurous atmosphere treatment as described above. For the subsequent

electrical test the specimens have to be fixed on an insulating plate (Figure 5).

Three lightning current impulses of 10/350 µs wave shape with 50 kA (normal duty) and 100 kA (heavy duty) are applied to every specimen. After being loaded with lightning current, the specimens must not show signs of damage.

In addition to the electrical tests where the specimen is subjected to electrodynamic forces in case of a lightning current load, a static-mechanical load was integrated in the EN 62561-1 standard. This static-mechanical test is particularly required for parallel connectors, longitudinal connectors, etc. and is carried out with different conductor materials and clamping ranges. Connection components made of stainless steel are tested under worst case conditions with a single stainless steel conductor only (extremely smooth surface). The connection components, for example the MV clamp shown in Figure 6, are prepared with a defined tightening torque and then loaded with a mechanical tensile force of 900 N ( $\pm 20$  N) for one minute. During this test period, the conductors must not move more than one millimetre and the connection components must not show signs of damage. This additional static-mechanical test is another test criterion for connection components and also has to be documented in the manufacturer's test report in addition to the electrical values.

The contact resistance (measured above the clamp) for a stainless steel clamp must not exceed 2.5 mΩ or 1 mΩ in case of other materials. The required loosening torque has to be ensured. A manufacturer's test report is prepared for every test combination. A detailed test report is available from the manufacturer upon request or a less detailed report (Figure 7) can be downloaded from the internet ([www.dehn-international.com](http://www.dehn-international.com) => Products => Product data).

Figure 5: Specimen fixed on insulating plate (MV clamp) for a test in the impulse current laboratory.

Consequently installers of lightning protection systems have to select the connection components for the duty (H or N) to be expected on site.

A clamp for duty H (100 kA), for example, has to be used for an air-termination rod (full lightning current) and a clamp for duty N (50 kA) has to be used in a mesh or at an earth entry (lightning current already distributed).

### Conductors

EN 62561-2 also places special demands on conductors such as air-termination and down conductors or earth electrodes e.g. ring earth electrodes, for example:

- Mechanical properties (minimum tensile strength, minimum elongation),
- Electrical properties (max. resistivity) and
- Corrosion resistance properties (artificial ageing as described above).

The mechanical properties have to be tested and observed. **Figure 8** shows the test set-up for testing the tensile strength of circular conductors (e.g. aluminium). The quality of coating (smooth, continuous) as well as the minimum thickness and adhesion to the base material are important and have to be tested particularly if coated materials such as galvanised steel (St/tZn) are used.

This is described in the standard in the form of a bending test. For this purpose, a specimen is bent through a radius equal to 5 times of its diameter to an angle of 90°. In doing so, the specimen may not show sharp edges, breakage or exfoliation. Moreover, the conductor materials shall be easy to process when installing lightning protection systems. Wires or strips (coils) are supposed to be easily straightened by means of a wire straightener (guide pulleys) or by means of torsion. Furthermore, it should be easy to install / bend the materials at structures or in the soil. These standard requirements are relevant product features which have to be documented in the corresponding product data sheets of the manufacturers.

### Earth electrodes / earth rods

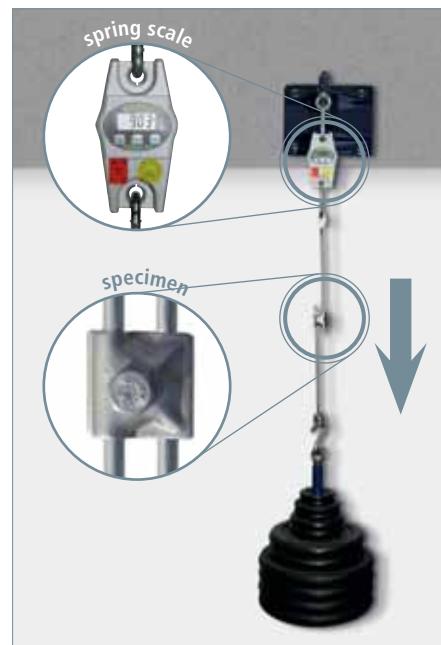

The separable DEHN earth rods are made of special steel and are completely hot-dip galvanised or consist of high-alloy stainless steel (StSt (V4A); material No. 1.4571). A coupling joint which allows connection of the rods without enlarging the diameter is a special feature of these earth rods. Every rod provides a bore and a pin end.

EN 62561-2 specifies the requirements for earth electrodes such as material, geometry, minimum dimensions as well as mechanical and electrical properties. The coupling joints linking the individual rods are weak points. For this reason EN 62561-2 requires that additional mechanical and electrical tests have to be performed to test the quality of these coupling joints.

For this test, the rod is put into a guide with a steel plate as impact area. The specimen consists of two joined rods with a length of 500 mm each. Three specimens of each type of earth electrode are to be tested. The top end of the specimen is impacted by means of a vibration hammer with an adequate hammer insert for a duration of two minutes. The blow rate of the hammer must be  $2000 \pm 1000 \text{ min}^{-1}$  and the single stroke impact energy must be  $50 \pm 10 \text{ [Nm]}$ .

If the couplings have passed this test without visible defects, they are subjected to artificial ageing by means of salt mist and humid sulphurous atmosphere treatment. Then the couplings are loaded with three lightning current impulses of 10/350 µs wave shape of 50 kA and 100 kA each. The contact resistance (measured above the coupling) of stainless steel earth rods must not exceed 2.5 mΩ. To test whether the coupling joint is still firmly connected after being subjected to this lightning current load, the coupling force is tested by means of a tensile testing machine.

**The installation of a functional lightning protection system requires that components and devices tested according to the latest standard are used. Installers of lightning protection systems have to select and correctly install the components according to the requirements at the installation site. In addition to mechanical requirements, electrical criteria of the latest state of lightning protection are to be considered and complied with.**

## Our engineering knowhow for your projects

In addition to our globally used protective devices, we also offer planning services. Our expertise is based on more than ten years of experience in planning lightning and surge protection solutions for different projects and industries. We have been planning industrial plants – e.g. petrochemical plants and power stations – as well as office buildings and production sites.

We provide planning services which are essential for the successful implementation of a project. As the requirements are country and sector specific, we cooperate closely with our customers. The basis for professional planning is good preparation. Project discussions and site surveys ensure high planning quality.

We create a lightning protection and earthing concept including drawings, mounting details, detailed descriptions, tender specifications and bills of material. We provide the planning documents to our customers so that they can create their own documentation. Upon request, a material quotation is available.

### Our services include:

- As-built data collection, project discussions, site surveys
- Risk analysis\*
- Assessment of material costs
- Planning of the lightning protection/earthing concept
- Lightning protection concept including detail engineering, detailed description and 3D/2D drawing
- Calculation of the separation distance
- Detailed mounting drawing of the air-termination system

## 3D planning of lightning protection concepts

Planning complex objects and structures by means of a 3D program allows to efficiently design air-termination systems while taking into consideration all parts of the structure. This way, the air-termination systems can be installed more effectively than if the 2D method AutoCAD is used.

Due to the increasing requirements regarding the building architecture, 3D planning is a very good solution for visually representing lightning protection measures. Based on our 3D planning, customers get an idea of how to integrate the lightning protection measures into the building architecture. Another advantage is the clear visualisation of the protected volume of the air-termination systems.

## 2D drawings and 3D planning?

3D planning ensures component-optimised design. No individual views and details of building outlines are drawn, but the building is virtually designed on the computer. In this process, a detailed 3D model is created. 2D drawings can also be generated from this 3D model.

This procedure has numerous benefits:

- All drawings always correspond to the latest version of the 3D model
- Faults are minimised due to a 360 degree view of the protected volumes around the building
- The installation company can improve coordination of the mounting process
- Any number of 2D and 3D view drawings can be generated from the 3D model
- In addition to the view drawings, any number of mounting details can be generated

## Components for Buildings with Thatched Roof

Lightning protection system components for thatched roofs. Air-termination conductors on thatched roofs have to be installed as elevated traverses e.g. on isolating supports. Certain distances have to be kept also to the eaves.

Intended span width for ridge conductors is approx. 15 m and for down conductors approx. 10 m without additional supports. Span stakes have to be fastened at the roof construction (rafters and crosspieces) by anchor bolts and flat washers.

Today often a high-voltage-resistant insulated (HVI) lightning protection system is the preferred external protection system to be installed on buildings with thatched roof (see page 155/156).

## High-voltage-resistant, insulated HVI® Conductor: Innovation in lightning protection

For preventing dangerous flashover between components of the external lightning protection system and conductive internal system components (electric lines, pipes, etc.) keeping the **separation distance s** is a crucial factor when designing and realising a lightning protection system.

### Unique design

When using conventional lightning protection systems, it is often not possible to maintain the necessary separation distances. This is no problem with the **HVI®Conductor** thanks to its unique design and special sheath. The lightning current carrying conductor of the **HVI®Conductor** is wrapped with insulating material in such a way that the required separation distance from other conductive parts of the building, electric lines and pipes is maintained. The coaxial conductor consists of an inner copper conductor with a high-voltage-resistant thick-walled insulation and a weather-resistant semi-conductive special outer sheath.

### Feature of the HVI®Conductor

High pulse voltages cause flashover on the surface of insulating material if no additional measures are taken. This effect is also referred to as creeping flashover. If the creeping discharge inception voltage is exceeded, a surface discharge is initiated which can easily flash over a distance of several meters. To prevent creeping discharges, the **HVI®Conductor** features a special outer sheath which allows to discharge high lightning impulse voltages to a reference potential. For functional reasons, a connection is established between the semi-conductive outer sheath and the equipotential bonding system of the building (no lightning voltage) in the sealing end range. This connection to the functional equipotential bonding system can be made e.g. on earthed metal roof-mounted structures located in the protected zone of the lightning protection system, earthed parts of the building's structure that do not carry lightning voltage or the protective conductor of the low-voltage system.

### Types of the HVI®Conductor

In 2003, DEHN launched an innovation in external lightning protection, the high-voltage-resistant, insulated **HVI®Conductor**. Since then, thousands of buildings and installations have been successfully equipped with **HVI®Lightning Protection**. This high number of installed **HVI®Conductors** and intensive development work gave us an expe-

rience advantage which is reflected in the variety of **HVI®Conductor** types which meet the different requirements that are posed on lightning protection systems.

The application range has been gradually expanded by **HVI®light**, **HVI®long**, **HVI®power**, **HVI®power long** and **DEHNcon-H**, which is available as pre-assembled set. Thus, **HVI®Conductors** can be used for an **extremely wide** range of application.

### The separation distance is crucial

The following overview makes it easier to select the right **HVI®Conductor**. The criterion for this selection is the **separation distance s**.

The IEC 62305-3 standard requires that a defined separation distance has to be kept as a minimum distance between the lightning protection system and electrically conductive materials. This prevents dangerous flashover and thus sparking, ensuring that lightning currents are reliably conducted to the earth-termination system. The high-voltage-resistant, insulated down conductors from DEHN provide an equivalent separation distance and thus meet the normative requirements.

**The separation distance can be calculated automatically by means of the DEHNsupport Toolbox software.**

### Types of the HVI®Conductor

Three types of the **HVI®Conductor** are available:

- **HVI®light**, **DEHNcon-H**
- **HVI®Conductor**, **HVI®long Conductor**
- **HVI®power**, **HVI®power long Conductor**

The **HVI®Conductor** types are different in strength and characteristics requiring individual installation specifications. In addition there are black and grey conductors within the HVI Conductor product line. With the additional grey sheath the **HVI®Conductor** installed at buildings has an improved aesthetic appearance.

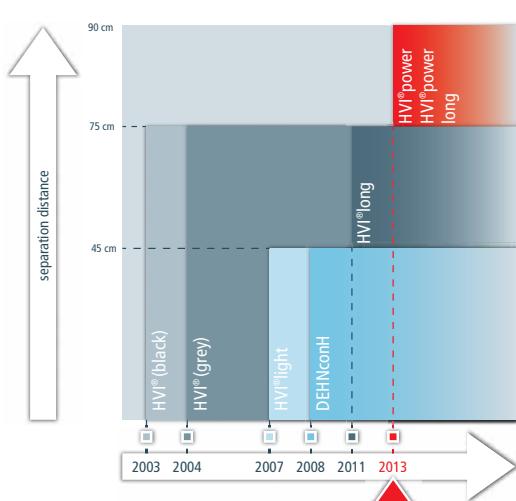

### HVI®Conductor in the self-supporting tube – dimensioned according to Eurocode

In addition to the material of the supporting tube with inside / outside installed HVI Conductor a sufficient stability is a crucial factor when choosing self-supporting air-termination systems. The area exposed to wind is larger with the HVI Conductors installed outside of the supporting tube, thus the standing surface and the necessary base weight has to be considered accordingly.

The speed of wind gusts is determined by means of the following parameters:

- **Wind zone (I-V)**
- **Terrain category**
- **Object height**
- **Location altitude above sea level (standard up to 800 m above sea level)**

The table lists the respective maximum wind gust velocities for self-supporting air-termination systems with HVI Conductor. They shall be compared with the defined values of the table wind gust velocities. If the max. wind gust velocity for an air-termination system is lower than the respective local velocity of wind gusts, the air-termination system suits for this application.

## HVI®light Conductor

The HVI light Conductor supplements the proven and tested HVI Conductor which has been used many times in practice. Designed for low, large-scale buildings where the separation distance cannot be maintained with conventional lightning protection systems.

A significant advantage of the HVI light Conductor is that it can be installed easily and quickly without sealing end.

A sealing end which is connected to the functional equipotential bonding system of the building is not required. Instead, the conductor is connected at a defined coupling point to the supporting tube in the tripod which does not have to be connected to the functional equipotential bonding system.

The roof area of buildings is often used as an installation level. Regardless of the potential risk of lightning strikes, pipes, electric and information technical systems or photovoltaic installations are installed there. All of these systems provide a conductive connection into the building along which lightning partial currents can flow into the structure where the sensitive electric / electronic equipment is interfered or even damaged. The insulated air-termination system prevents this transfer of lightning

partial currents into the building. The HVI light Conductor is the system to maintain the separation distance on flat roofs. The high-voltage-resistant, insulated HVI light Conductor prevents an uncontrolled flashover to metal or electric components underneath the roofing.

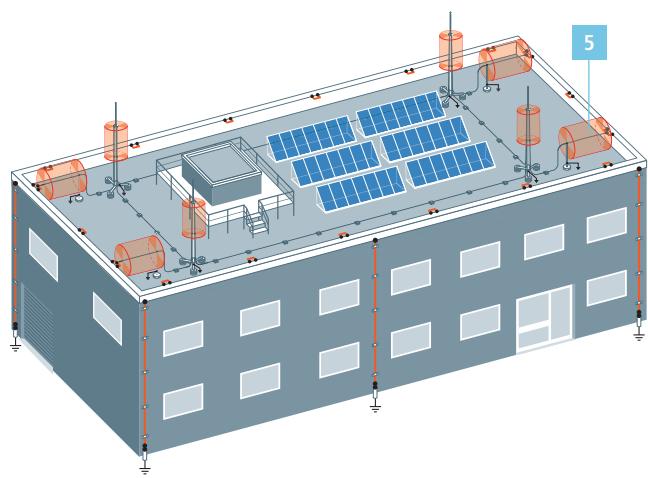

The conductor is delivered in a length of 100 m on a disposable plywood reel (diameter approx. 800 mm, width approx. 485 mm) and an Allen key included in delivery.

- high-voltage-resistant, insulated HVI light Conductor to maintain the separation distance to electrically conductive parts according to IEC 62305-3 (VDE 0185-305-3)
- equivalent separation distance  $s \leq 0.45$  m (in air) or
- $s \leq 0.90$  m (solid material)
- the HVI light Conductor meets the requirements according to EN 62561-2 (VDE 0185-561-2)

Connection of the HVI light Conductor to an existing lightning protection system. The equivalent separation distance  $s$  at the connection point of the HVI light Conductor is  $\leq 45 \text{ cm}$  (in air).

In the connection area an adjustment range around the HVI light Conductor has to be provided. No electrical, conductive or earthed parts may be installed in this area. This is necessary to inject the lightning current safely into the conductor. An equipotential bonding connection is not necessary.

Installation of bare, uninsulated conductors can pose the problem of proximities in case of residential buildings or buildings of lower height. The consequent maintenance of the required separation distances is often not possible. Requirements for maintaining of the separation distance are specified, in the lightning protection standard IEC 62305 (VDE 0185-305) and also in communication technology standards. DIN EN 60728-11 (VDE 0855-1) points out that radio masts on buildings with lightning protection system shall be integrated preferably insulated (separated) in this system. The DEHNcon-H is ideally suited for this application.

- Optically appealing due to the HVI/HVI light Conductor being installed inside of the supporting tube, reduced size of the supporting tubes and low weight of the whole structure, also fitting for subsequent installation at existing antenna poles.
- High-voltage-resistant, insulated down conductor for keeping the separation distance from electrically conductive parts according to IEC 62305-3 (VDE 0185-305-3).
- Supporting tube with insulating clearance made of glass-fibre reinforced plastic (GRP)
- Material factor  $km = 0.7$
- Colour light grey, UV-stabilised

The HVI light / HVI Conductor meets the requirements according to EN 62561-2 (VDE 0185-561-2).

The HVI / HVI long Conductor can be used for a wide range of installation variants to protect for example larger roof-mounted structures, antennas as well as masts with information technology systems against direct lightning strike. Due to the special characteristics this conductor can also be directly routed to the earth-termination system. If this is not required, connection to already existing conventional lightning protection systems (elevated / separated ring conductor) is also possible.

With the high-voltage-resistant, insulated conductor a separation distance to electrically conductive parts according to IEC 62305-3 is maintained. Equivalent separation distance  $s < 0,75$  m (air) or  $s < 1,5$  m (solid material).

### **HVI®Conductor pre-assembled**

The pre-assembled HVI Conductor is delivered with one head piece and one connection element (loosely included). The following types are available:

- HVI Conductor pre-assembled for installation inside of tube
- HVI Conductor pre-assembled for installation outside of tube

### **HVI®long Conductor**

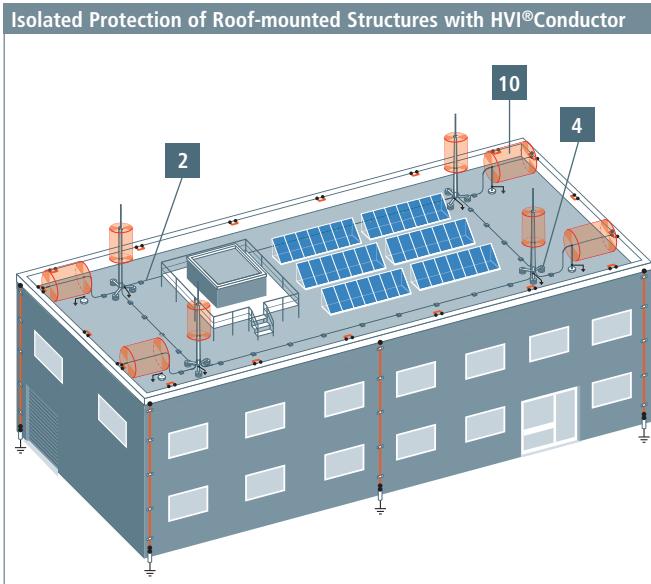

Due to an undefined or changing building situation in case of new buildings or building restorations, the exact conductor length can rarely be defined at the design stage of the lightning protection system. Therefore, the HVI long Conductor can be assembled on site.

The HVI long Conductor is available in a length of 100 m on a disposable plywood reel (diameter approx. 800 mm, width approx. 485 mm) with one Allen key included in delivery. The installer determines the exact length on site, cuts the conductor to length, strips it and attaches the sealing ends.

## 10 Sealing End Range, Connection to "Isolated Ring Conductor"

If several parts of an installation are to be protected, it is not advisable to route the HVI Conductor from each air-termination system to the earth-termination system. The HVI Conductors from the air-termination system can be connected to e.g. an „isolated ring conductor“. From this isolated ring conductor, several down conductors can be routed to the earth-termination system. The „isolated ring conductor“ has to be installed on spacers and concrete bases e.g. on the roof level. The calculated separation distance „ $s$ “ must be observed.

## 10 Sealing End Range, Connection to "Capping of Roof Parapet"

If several parts of an installation are to be protected, it is not advisable to route the HVI Conductor from each air-termination system to the earth-termination system. The HVI Conductors from the air-termination system can be connected to the capping of the roof parapet. From this capping of the roof parapet, several down conductors can be routed to the earth-termination system.

## 10 Sealing End Range on a Building's Structure

If HVI Conductors are installed on a building's structure, the calculated separation distance „*s*“ in the sealing end range from the metal parts in the building's structure must be maintained. The sealing end ranges from the EB connection element to the connection of the earth connection element.

If the HVI Conductor is directly connected with an earth entry rod / earth-termination system an EB element is not necessary. The sealing end range remains unconsidered.

The HVI power Conductor is the most powerful variant of the high-voltage-resistant, insulated down conductors (HVI Conductors). Compared with the standard HVI Conductor it allows to maintain an equivalent separation distance of 0.9 m in air and 1.8 m in solid material. It shall be pointed out in particular that the HVI power Conductor and the corresponding components are tested for a lightning current carrying capability of up to 200 kA (10/350 µs). Therefore this type of conductor may be used for all classes of LPS (I-V).

This conductor is installed preferably on buildings such as hospitals, computing centres or silos where due to the building dimensions (height) wide separation distances are to be maintained. Also the conductor can be routed over a longer distance down to the earth-termination system. The conductor is installed inside of the supporting tube. The required functional equipotential bonding for the sealing end is automatically provided by the interior EB spring element. Connection of the supporting tube with the functional equipotential bonding of the building is not necessary.

### Pre-assembled HVI®power Conductor

The pre-assembled HVI power Conductor is delivered with one head piece and one connection element (loosely included). Minimum order length is 6 m, additional conductor lengths in steps of 0.5 m. Conductor lengths to be indicated when ordering.

### HVI®power long Conductor

## 5 Sealing End Range, Connection to "Isolated Ring Conducutor"

If several parts of an installation are to be protected, it is not advisable to route the HVI power Conductor from each air-termination system to the earth-termination system. The HVI power Conductors from the air-termination system can be connected to e.g. an "isolated ring conductor". From this isolated ring conductor, several down conductors can be routed to the earth-termination system. The "isolated ring conductor" has to be installed on spacers and concrete bases e.g. on the roof level. The calculated separation distance "s" must be observed.

## 5 Sealing End Range, Connection to "Capping of Roof Parapet"

If several parts of an installation are to be protected, it is not advisable to route the HVI power Conductor from each air-termination system to the earth-termination system. The HVI power Conductors from the air-termination system can be connected to the capping of the roof parapet. From this capping of the roof parapet, several down conductors can be routed to the earth-termination system.

## 5 Sealing End Range on a Building's Structure

If HVI power Conductors are installed on a building's structure, the calculated separation distance „ $s$ “ in the sealing end range from the metal parts in the building's structure must be maintained. The sealing end ranges from the EB connection element to the connection of the earth connection element.

If the HVI power Conductor is directly connected with an earth entry rod / earth-termination system an EB element is not necessary. The sealing end range remains unconsidered.

## Protection against Step and Touch Voltage

IEC/EN 62305-3 points out that in special cases outside of a building the touch voltage may be extremely dangerous near the down-conductors, although there is a lightning lightning protection system in accordance with the state of standardisation.

As applies for example, if bare/uninsulated down conductors and lightning protection earth electrodes are installed near the entrance or sheltering areas of buildings with high visitor frequency, such as theatres, cinemas, shopping centres etc. Especially exposed (lightning endangered) buildings or structures of public access (e.g. shelters) may also require touch voltage protection measures.

Touch voltage is defined as the voltage affecting somebody standing on the ground in a distance of approx. 1 m from the down conductor and who touches the down conductor. In such a case the current flows from the hand into the body down to the feet (see **Figure 1**).

The hazardous area for persons outside of a building is defined as an area of 3 m around the down conductor and from ground level up to a height of approx. 3 m.

According to IEC/EN 62305-3 Subclause E.4.2.4.2, the area to be protected against touch voltage corresponds to the height of a person with raised arm plus the separation distance  $s$  (see **Figure 2**).

Additionally, the step voltage in the surrounding of the building/down conductor has to be taken into account.

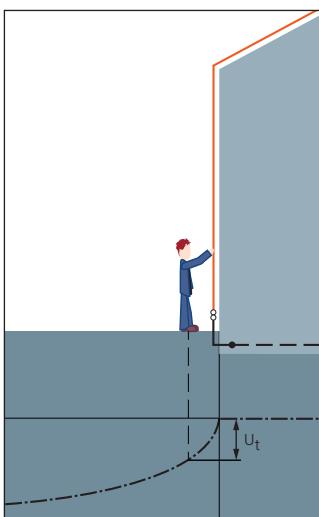

Figure 1: Schema diagramm – touch voltage  $U_t$

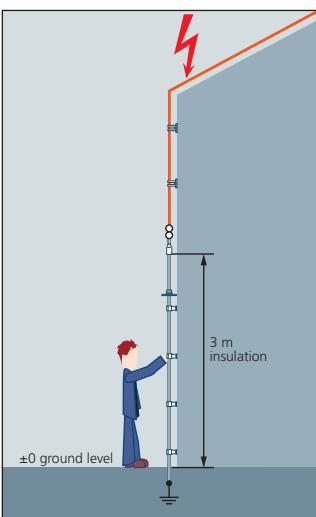

Figure 2: Protective measures

Effective protection measures against injuries due to touch voltage are defined according to the standard as follows:

- Installation of an insulated (coated) down conductor providing a surge withstand capability of 100 kV at 1.2/50  $\mu$ s, e.g. an at least 3 mm thick cross-linked polyethylene;
- physical restrictions and/or warning signs to minimise the possibility of down conductors being touched.

The CUI conductor (**CU** copper Insulated) has an inner cooper conductor with a diameter of 8 mm and a high-voltage-resistant insulation (see **Figure 3**).

Figure 3: Design of a CUI conductor

### Requirements:

- Surge withstand capability of 100 kV (1.2/50  $\mu$ s)
- Prevention of creepage sparkover even at rain.

The surge withstand capability of 100 kV (1.2/50  $\mu$ s) is achieved by a special cross-linked polyethylene insulation (XLPE). Unless additional measures are taken, high impulse voltages cause sparkovers at insulating surfaces. This effect is known as creeping discharge. If the creeping discharge inception voltage is exceeded, a surface discharge will be initiated, which can easily spark over a distance of several metres to earthed parts. In order to avoid arising creeping discharges even at rain, the CUI conductor additionally has a shield which keeps the conductor dry. This shield on the conductor and the drops after the rain test is shown in **Figure 4**.

Figure 4: Rain test

Application in the entrance area

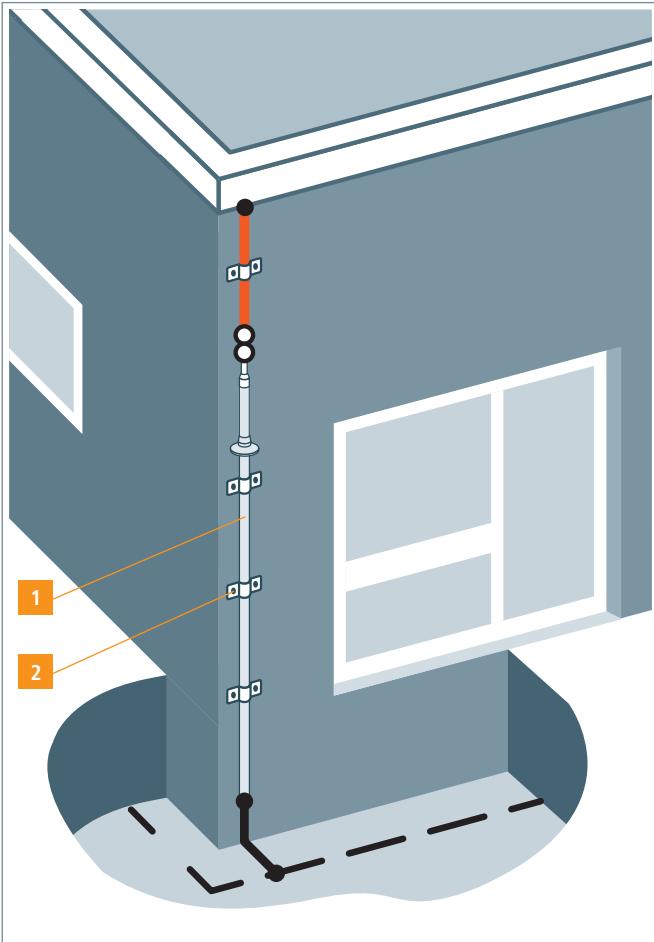

Development of the CUI conductor is based on the "rain test" according to IEC 60-1 Subclause 9. At this test a defined quantity of water is sprayed on the conductor in an angle of approx. 45° (see **Figure 4**).

## Protection against step voltage

In IEC 62305-3 not only the risk of touch voltage but also the risk of step voltage is pointed out. The risk for living beings can be reduced by protective measures. In addition to an increasing of the resistance of the upper ground layer (ground insulation, e.g. by asphalt), applying of barriers or warning signs, also a meshed earth-termination system can be installed. This earth-termination system is installed in addition to the existing earth-termination system as a so-called potential control grid in the area around a down conductor.

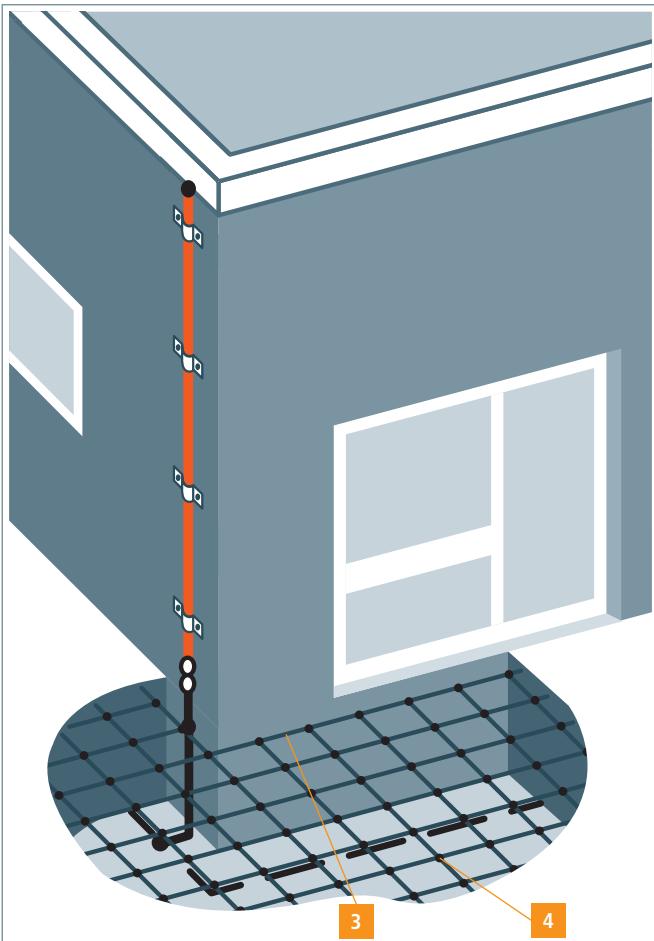

In the German ABB leaflet „Blitzschutz von Schutzhütten“ ("Lightning Protection for Shelters") a mesh size of < 25 x 25 cm is recommended for the potential control grid. The grid shall be preferably installed in a low depth of maximum 25 cm under the surface. The material should be stainless steel StSt V4A (e.g. material No. 1.4571). The metal grid has to be connected with the earth-termination system every 4 m (at least at all corners).

## 1 CUI Conductor

Touch voltage at down conductors can be avoided by the CUI conductor.

The dangerous area of touch and step voltages for living beings is defined as an area of approx. 3 m around the down conductor, from ground level up to a height of approx. 3 m.

The CUI conductor has a copper core and a high-voltage-resistant insulation.

These conductors shall meet the requirements of a:

- Surge withstand capability of 100 kV (1.2/50 µs)
- Prevention of creeping flashover even at rain

## Connecting Clamps for Reinforcements

In accordance with the German standard DIN 18014: 2014-03 Fundamenteerde - Planung, Ausführung und Dokumentation (Title English: Foundation earth electrode - Planning, execution and documentation), foundation earth electrodes have to be connected every two meters with the foundation plate. Among the various connection possibilities the clamping connection has turned out to be the most economic, as it can be realised fast and easily on site.

Among others also reinforcing steels shall be used as natural components of the down conductor system according to the current lightning protection standards. In the following a survey of the nominal and outer diameters as well as cross sections of the reinforcing steels DIN EN 10080: 2005.

For connecting concrete reinforcing mats or reinforcements with round and flat conductors.

Arrangement: (II) = parallel (+) = cross

The outer diameter including corrugation is approx.  $d_A = 1.15 \times d_s$ .

Nominal diameter $d_s$ (mm)	6	8	10	12	14	16	20	25	28	32	40

## Notes

This catalogue replaces the Main Lightning Protection / Earthing Catalogue 2015.

Since we do not plan systems or parts of systems, our product recommendations should be regarded as product information and for advisory purposes only. Our oral and written application proposals are based on experience and are specified to the best of our knowledge. We do not accept any liability in this respect. This particularly applies to the different conditions of use which are beyond our control. We recommend to check whether the respective DEHN product is suitable for the intended application. Application, use and processing of our products are beyond our control. Therefore, the product is completely subject to the user's responsibility.

Illustrations are not binding.

We accept no liability for misprints, modifications and errors.

# General Terms of Sale\*

- 1. General, Scope**
  - All deliveries and services in business dealings with entrepreneurs take place exclusively under our general terms of sale (hereinafter "terms of sale"). We oppose deviating regulations, especially conflicting terms of purchase of the customer, unless we expressly agreed to the validity in writing. Our terms of sale apply even if we complete unconditional delivery to the customer while knowing that the terms of sale of the customer are in conflict with our own.
  - Our terms of sale only apply to entrepreneurs within the meaning of section 310, paragraph 1 of the German Civil Code (BGB), to current business relationships and to all future transactions with the customer.
- 2. Offer and Order, Reservation of Right of Modification and Copyright**
  - Except where expressly identified by us as binding, documents such as diagrams, drawings and measurements, in particular in print media and online on our website [www.dehn-international.com](http://www.dehn-international.com), are only indicative.
  - Should our order confirmation contain reasonable expansions, limitations, or other modifications with respect to the order, then the customer's agreement is implied, if he/she does not immediately, at the latest however within 3 business days from receipt of the order confirmation, oppose it.
  - Any order placed in our web shop shall be regarded as an offer to conclude a sales contract. A sales contract only comes into existence if the customer receives a written order confirmation or the goods are delivered / services are rendered.
  - Our goods are only delivered in the packaging units indicated in the catalogues. If a different number of items is ordered, the amount and price of the next larger packaging unit is considered agreed upon.
  - We reserve the right to make technical modifications to our services, insofar as such modifications promote technical progress or are unavoidable based on other circumstances and are reasonable for the customer.
  - We reserve ownership and copyright rights to diagrams, drawings, calculations, and other documents; these may not be made available to third parties without our express written consent.
- 3. Prices, Value-Added Tax, Packaging Costs**
  - Our prices are subject to change without notice.
  - Prices include, insofar as nothing else is arranged, customary packaging from our plant without value-added tax. On the day of invoicing, the legally identified VAT amount is to be reimbursed to us.
  - The cost of non-customary packaging, e.g., collective or seaworthy packaging, is invoiced separately. The customer bears the cost of the disposal or return of packaging.
- 4. Passing of Risk, Optional Insurance**

The risk of accidental loss and deterioration passes to the customer upon dispatch to the customer from our warehouse or plant, even if carriage-paid delivery is agreed upon. At the request and expense of the customer, we will insure the delivery against breakage, damage to goods in transit and fire damage.
- 5. Payment Due Dates, Discounts, Right of Refusal, Default, Small Order Quantity Surcharge**
  - Unless otherwise agreed, invoices are payable net 10 days. The customer shall pay the costs of payment. Discount amounts are deductible only if they have been agreed on with us and all accounts payable due have been paid.
  - If the customer is in default with his payments, interest on the outstanding amount shall be payable at the rate of 9 % above the base interest rate. We reserve the right to prove and allege higher default damages. The right of early notice of default remains unchanged. If we are required to advance performance and, if after the execution of the contract, it becomes apparent that our claim, in particular for payment, may be jeopardised by the customer's inability to perform, we may refuse performance.
  - The customer cannot charge counter-claims against our due payment claims or exercise a right of retention, unless the customer is entitled to a claim recognised by declaratory judgement that is not contested by us and if, while exercising the right of retention, the counter-claim from the customer is based on the same contractual relationship.
  - Orders, with the exception of cash sales, for which the net amount (invoiced amount without shipping costs and value-added tax) is less than € 75.00, a small order surcharge of € 25.00 will be charged.
- 6. Retention of Title, Assignment, Release of Securities**
  - Delivered goods remain our property until the payment of all open business claims up to the point of invoicing. The claims of the customer including value-added tax from the resale of reserved goods, i.e., from a work performance using our goods, should already be transferred to us in the amount of the open invoice. In the case that the reserved goods from the customer are sold together with other goods that do not belong to us, whether it be without or after processing, or are delivered within the framework of a working contract, the assignment of the resulting claim of the reserve buyer is calculated in the amount of the value of the reserved goods.
  - Should the value of the granted securities exceed the claims by more than 10 %, we are obliged to retransfer or release the securities upon request. We shall select the securities to be released.
  - Our goods may only be transferred within the framework of proper business activity. The customer is not allowed to pawn or transfer the ownership of goods that are still in our possession.
  - At our request, the customer is obliged to inform us of the purchaser and the arranged price and to show the assignment to its debtor.
- 7. Delivery Period and Date**
  - The start of the delivery period presupposes the involvement of the customer for the clarification of all technical questions.
  - Delivery periods as well as delivery dates will be appropriately extended if they cannot be adhered to as a result of military mobilisation, war, uprising, strike or lockout, delayed delivery of raw and auxiliary materials, late delivery by our suppliers, or similar circumstances beyond our control. A lasting obstruction under these circumstances gives us the right to withdraw from the contract without liability for damages.
- 8. Liability for Material and Title Defects**
  - We shall assume liability without restriction in compliance with the statutory regulations, provided that the customer asserts claims for damage compensation, which are attributable to wilful intent or gross negligence, including wilful intent and gross negligence on the part of our representatives or vicarious agents.
  - We shall assume liability without restriction in compliance with the statutory regulations, in case of culpable injury to life, limb or health; this shall also apply to the mandatory liability under the Product Liability Act.
  - In so far as a defect of the subject of the contract exists for which we are liable, we shall at our discretion either remedy the defect or deliver a non-defective object of the contract (subsequent performance).
  - If said subsequent performance should fail or if it is unreasonable for the customer, or if we refuse seriously and conclusively to do so or if we have delayed rectification unreasonably or if other circumstances prevail, which justify immediate withdrawal or damage compensation, taking account of the interests on both sides, then the customer shall be entitled to reduce the contract price or to withdraw from the contract and/or to demand damage compensation. In the event of only a slight infringement of contract, in particular in the event of only slight defects, the customer shall not be entitled to withdrawal.
  - If the customer should choose only damage compensation after the failure of subsequent performance, then the subject of the contract shall remain with the customer, if this can be reasonably expected. Damage compensation shall be restricted – subject to item 8.1 and 8.2 – to the difference between the purchase price (without value added tax) and the value of the defective subject of the contract remaining with the purchaser.
  - Insofar as not otherwise specified above, liability shall be excluded.
  - The limitation period for claims based on defects, – subject to item 8.1 and 8.2 – shall be 12 months from delivery of the goods.
  - Items 8.1 to 8.7 shall not affect the rights of the customer, if we have fraudulently concealed a defect or have assumed a guarantee for quality.
- 9. Overall liability**
  - Any further liability for compensation than that provided in item 8 – irrespective of the legal nature of the asserted claim – shall be excluded. This shall in particular apply to damage claims for liabilities resulting from culpa in contrahendo, for other breaches of duty or for tortious claims for damage compensation acc. to § 823 BGB (German code civil law).
  - Limitation according to 9.1 shall also apply, insofar as the customer claims reimbursement for useless expenditures instead of claiming compensation for damages in place of performance.
  - As far as the liability for compensation against us is excluded or restricted, this shall also apply with regard to the personal liability for damages of our employees, workers, representatives and vicarious agents.
- 10. Return of Goods without Legal Liability**
  - If no legal claim to return exists, delivered goods will be accepted only with previous agreement from us. Returns without previous agreement will be send back – postage due – to the sender without inspection. The customer bears the shipping costs for the return delivery in No. 10.1.
  - The goods must still be in the original packaging. Special orders or deliveries dating back further than three months cannot be returned. In order to cover the costs of goods returns, a processing fee of 20 % of the net value of the goods or € 25.00, whichever is the greater, shall be applied, unless the customer can prove to us that we have incurred no or considerably smaller damage. If the goods can no longer be resold at the list price at the time of the return, an additional deduction (old goods deduction) will be made in addition to the processing fee. If we make an exception and agree to accept the return of parts that are unpackaged or that are no longer in their original packaging, an expense remuneration of at least 15 % will be charged for reworking and repackaging in addition to the processing fee and, if applicable, the old goods deduction, unless the customer can prove to us that we have incurred no or considerably smaller damage.
  - Returned goods will only be credited to a new invoice. Credits cannot be used to clear invoices due at the time of the return.
- 11. Product Information, No Advisory Obligation**

Our deliveries are intended only for speciality stores or skilled users. Our user information and instructions are limited to the details of each written product information (e.g., installation instructions, catalogues, data sheets). Further advisory obligations do not exist. Application, use, and processing of the products lie solely in the customer's realm of responsibility.
- 12. Additional Conditions for the Provision of Services**
  - We make our offers without conducting a separate test to ascertain the suitability of the products for the relevant customer project. Our liability is excluded unless we were aware of anything contrary to suitability or we were not so aware due to gross negligence. The customer is responsible for conducting the requisite test.
  - We also make our offers on the basis of the specifications submitted by the customer without conducting a separate test to ascertain the suitability of the products on an individual basis. Our liability is excluded unless we were aware of anything contrary to suitability or we were not so aware due to gross negligence when checking the specifications. The customer is responsible for conducting the requisite test.
  - Our application proposals with product recommendations are of a general nature and are neither designed for application to an individual case nor intended to enable such application. Our application proposals are therefore non-binding. We do not accept any liability in this respect. It is absolutely essential to conduct an appropriate test on an individual basis. The customer is responsible for conducting such a test.
  - Our concept proposals with product recommendations do not replace the prevailing recognised engineering standards. The concept proposals with product recommendations do not claim to be exhaustive, unless expressly agreed otherwise. We do not plan systems or parts thereof. In particular, our concept proposals with product recommendations do not replace specific planning and testing. This lies in the customer's realm of responsibility. We do not accept any liability in this respect.
  - The sole purpose of the seminars we organise for the customer is to broaden his knowledge and to enable him to check his level of knowledge. We do not monitor and test the knowledge that the customer acquires and applies. We do not accept any liability in this respect. The seminars will always be kept up to date so that they meet the requirements of the recognised engineering standards.
- 13. Use and Protection of Customer Data**

We use customer data, which concern the business dealings with the customer, in terms of the Federal Data Protection Act.
- 14. Applicable Law, Jurisdiction**
  - German law applies to the mutual contractual obligations, their materialisation, interpretation, and implementation as well as all resulting contractual and business relationships. The application of the UN Agreement on Contracts on the International Purchase of Goods and the thereafter enacted laws of the Federal Republic of Germany is excluded.
  - Place of performance and jurisdiction for delivery, payment, and for all obligations, including those from exchange and cheque payments – if the customer is a businessperson, legal entity of public law or of special fund under public law – is exclusively Nuremberg.
- 15. VAT Identification Number**

VAT ID No. DE 133251475
